# SYNERGIES BETWEEN MONETARY POLICY AND NATIONAL POLICIES IN A MONETARY UNION

The authors of this article are Óscar Arce, Samuel Hurtado and Carlos Thomas of the Directorate General Economics, Statistics and Research.

This article analyses, in the context of a monetary union, the existence of positive synergies between a monetary policy geared towards keeping interest rates low for a relatively prolonged period and demand and supply-side stimulus measures implemented by national authorities.<sup>1</sup> For this purpose, various exercises are carried out using a macroeconomic model that reproduces a context of persistently low inflation in a monetary union, with nominal interest rates constrained by an effective lower bound, like the one that currently characterises the euro area. The analysis conducted suggests that national stimulation policies (such as fiscal expansions in those members of the union with scope for them and structural reforms in those with less efficient markets) have greater expansionary effects on economic activity and inflation in the short and medium term when, in parallel, the common central bank applies an expansionary monetary policy to keep interest rates low for an extended period.

Introduction The global financial crisis that began in 2008 led to a severe and prolonged contraction in the activity of the main developed economies, accompanied by a notable decline in inflation rates that has continued up to the present. That said, developments across countries and regions have been uneven, so that, while GDP growth and inflation have recovered notably in the United States, in the euro area growth remains weak and inflation is still below the medium-term price stability benchmark (i.e. below, but close to, 2%).

Against this background, the euro area monetary authorities, and some of the main international economic institutions, have stressed the need for euro area national governments to take measures to supplement the efforts made in the area of monetary policy.<sup>2</sup> These measures include, on one hand, the need for countries to introduce structural reforms to improve the efficiency of their product and factor markets and to promote higher potential growth and, on the other hand, the possibility that fiscal policy should assist monetary policy in those countries where there is scope for it to do so.

An important issue in this context is the possibility that each of these economic policy measures may reinforce the expansionary effects of the others, i.e. there may exist positive synergies between monetary policy and national supply and demand policies. The presence of such synergies between different economic policy tools would be a further reason in favour of their joint implementation.

This article analyses the existence of such synergies in a context intended to approximate the economic situation currently facing the euro area, i.e. a monetary union characterised

by persistently low levels of inflation, weak growth, low interest rates (with limited scope for further reductions given the effective lower bound) and, in some countries, the need for households and firms to deleverage. For this purpose, various quantitative exercises are presented, to highlight the mechanisms which, in a context like the one described, may give rise to positive synergies between monetary policy, fiscal policy and structural reforms. The second section of the article describes the basic aspects of the model used and the third section examines in detail the effects of the joint application of various policies by the different economic authorities of the monetary union and their transmission channels.

A macro-financial model of monetary union The macroeconomic model used approximates the euro area by considering two different regions: the periphery and the core. Markets in both regions are characterised by a number of frictions. In financial markets, households and firms borrow long term, their capacity to borrow being constrained by the market value of the assets that serve as collateral in lending transactions.<sup>3</sup> Also, product markets and the labour market suffer from certain imperfections that limit the degree of competition and efficiency.<sup>4</sup> These two regions have different initial levels of private debt, that in the periphery being higher, and the latter suffers a more acute and lasting tightening of its financial conditions. This model can therefore be interpreted as a stylised representation of the functioning of monetary union characterised by asymmetry in the behaviour of certain markets and in the starting conditions of the member countries.

> A baseline scenario, constructed on the basis of the model, is presented below, which is then used to simulate the impact of various economic policy measures. This starting scenario is designed to replicate some of the main elements that characterise the current macro-financial situation in the euro area, such as i) the liquidity trap which arises because the ECB's nominal reference interest rates are at (or very close to) their effective lower bound; ii) expectations of low inflation for a prolonged period; and iii) private sector deleveraging in certain member countries.

> In order to reproduce these current circumstances of the euro area, first, a negative shock common to the entire monetary union is introduced into the model, which reduces consumer demand. The negative impact of this shock on actual inflation at the overall monetary union level leads the central bank to reduce nominal interest rates to their effective lower bound, resulting in a liquidity trap. Second, the credit conditions in the periphery are considered to suffer a negative shock that solely affects this region, inspired by the financial origin of the recent global crisis, which leads households and firms to face a prolonged phase of gradual deleveraging.<sup>5</sup>

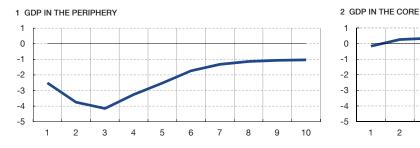

It is important to stress that the duration of the liquidity trap and of the private sector deleveraging phase are endogenous, in the sense that the former continues until the inflation of the monetary union recovers sufficiently, following the negative shocks described, for the central bank to raise interest rates, and the latter continues until the balance sheet position of households and firms improves sufficiently to allow the flow of new credit to resume. Economic policies may affect the duration of these two processes, for example, shortening the private deleveraging phase.

<sup>3</sup> Specifically, real estate assets, both residential and commercial, are used as collateral for loans.

<sup>4</sup> The product market is subject to competitive distortions, so that firms apply a mark-up over their marginal cost, while prices are partially rigid. In the case of the labour market, similar distortions are considered, specifically the nominal wages paid enjoy a positive mark-up over the reservation wages, and they are reviewed only occasionally.

<sup>5</sup> In particular, a gradual and permanent reduction in the maximum loan-to-value ratios for loans to households and firms is simulated.

a Deviations from the initial steady state, except for the nominal interest rate and the debt/GDP ratio which are in levels. Horizontal axis in years.

Although the model incorporates a broad range of realistic elements, its calibration is not designed to reproduce quantitative variable responses that can be interpreted from an empirical perspective. Accordingly, the magnitudes in the exercises presented below are only illustrative of the qualitative behaviour of the channels and of the most relevant variables of the model.

Chart 1 shows the response of the main variables of both regions in the scenario described. The negative shocks mentioned above lead to a very sharp contraction in GDP in the periphery, where the contraction of private credit exerts a considerable negative impact on the spending of households and firms, while the impact on the rest of the area is modest, due, among other factors, to the sharp reduction in nominal and real interest rates. The latter, however, is not sufficient to avoid a persistent decline in inflation rates in both regions which increases the real value of the payments associated with nominal debt, through the "debt deflation" channel (known as the "Fisher effect"), which hinders the deleveraging process in the periphery.<sup>6</sup> The decline in inflation in the monetary union as a whole leads the central bank to reduce the nominal interest rate until it reaches its lower bound (which, for simplicity, is assumed to be 0%) during the first year.

After approximately a year, inflation in the monetary union as a whole improves sufficiently for the nominal interest rate to leave its lower bound. In the periphery, after several years of deleveraging, firms and households recover their access to new lending, with the consequent rise in the volume of lending and economic activity.<sup>7</sup>

The role of economic policies The possibility of a scenario that includes the above-mentioned adverse factors (demand weakness, aggravated in the periphery by deleveraging, and very low inflation for a prolonged period, with nominal interest rates at their lower bound) poses significant challenges for the application of the various economic policies at euro area level. Among the measures proposed in this context to reduce the negative impact of these adverse factors, three have particularly attracted the attention of the authorities: structural reforms in product and factor markets, countercyclical fiscal policies and non-standard monetary policy measures. The macroeconomic model described above allows the approximate incorporation of various measures in these three categories, and their impact in relation to the baseline scenario described in the previous section to be assessed. The following exercises show the effect of these measures and the possible interactions between them.

THE AGGREGATE EFFECTSWith respect to structural reforms, various measures applied in the periphery to increaseOF NATIONAL POLICIESthe degree of competition in product markets and to reduce labour market inefficiencies<br/>are considered below.8 As an example of countercyclical fiscal policy, a temporary<br/>expansion of public spending in the core of the monetary union is considered.9

Chart 2 shows the effects (with respect to the baseline scenario) of the two national level policies: structural reforms in the periphery (green lines) and fiscal expansion in the core (red lines). This latter measure has a temporary expansionary effect in the region in which it is applied, and also – albeit a smaller one – in the neighbouring region. The reason is that, with nominal interest rates at their lower bound during several periods, the inflationary impact of this measure tends to reduce real interest rates in both sets of countries, producing a positive spillover in the periphery. In this respect, in contrast to what would happen if monetary policy were not constrained by the nominal interest rate lower bound, the fact that the monetary authority does not raise its interest rates in response to the inflationary impact of this fiscal measure means that it has a considerably more expansionary effect on the activity and prices of the area as a whole.<sup>10</sup>

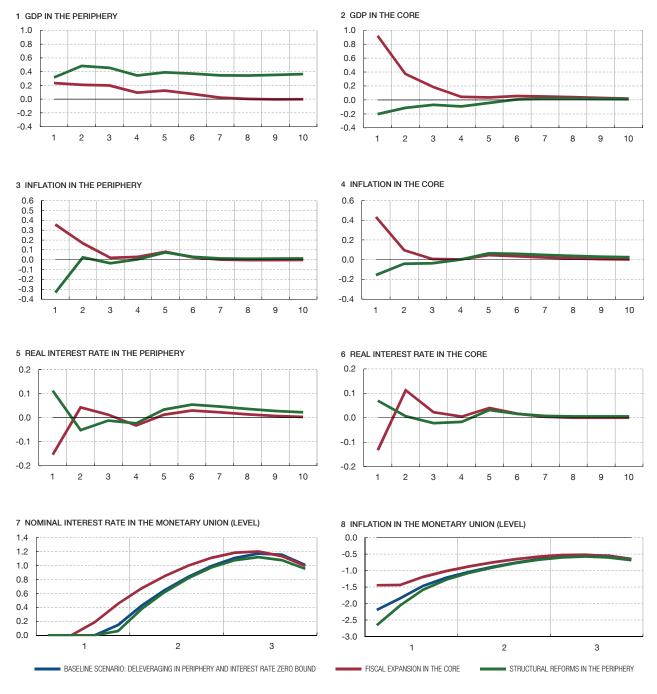

<sup>6</sup> For a detailed analysis of this mechanism, in the context of a similar model, see J. Andrés, Ó. Arce and C. Thomas (2014), Structural Reforms in a Debt Overhang, *Documentos de Trabajo*, No 1421, Banco de España.

<sup>7</sup> The deleveraging phase is somewhat longer for households because, as seen in practice, the average maturity of their debt is longer.

<sup>8</sup> As mentioned, the model incorporates monopolistic distortions in product markets and in the labour market, so that prices incorporate a mark-up over the marginal cost of production (price mark-up) and nominal wages incorporate a mark-up over the reservation wage (wage mark-up). Thus, the structural reforms in the periphery consist of permanent reductions in price and wage mark-ups, specifically of 1% in each case.
9 In particular, it is assumed that the expansion of public spending is 1% of core GDP.

<sup>10</sup> For a detailed analysis of the spillover of fiscal policy across the countries/regions of monetary area, see also O. Blanchard, C. J. Erceg and J. Lindé (2016), "Jump-Starting the Euro Area Recovery: Would a Rise in Core Fiscal Spending Help the Periphery?", NBER Macroeconomics Annual 2016, vol. 31.

# EFFECTS OF NATIONAL POLICY MEASURES (a)

SOURCE: Banco de España.

a Marginal effects of structural reforms in the periphery and public expenditure in the core on a baseline scenario with deleveraging and zero interest rates. Deviations from the baseline scenario, except for the nominal interest rate and inflation in the monetary union which are in levels. Horizontal axis in years.

Structural reforms in the periphery boost economic activity in this region not only in the medium and long-term, as one would expect, but also in the short term, basically as a result of their positive impact on external competitiveness and private deleveraging. In particular, the anticipation of the medium and long-term positive effects stimulates, through the expectations channel, short term spending and hiring, which, in turn, helps to mitigate the duration and intensity of the contractionary deleveraging process and, therefore, to bring forward the recovery.<sup>11</sup> Such reforms, however, unlike in the case of

<sup>11</sup> See J. Andrés, Ó. Arce and C. Thomas (2014), cited in Footnote 6 above, for a detailed analysis of the shortterm effects of structural reforms in a model similar to the one used here.

fiscal expansion in the core, have a deflationary impact. This, along with interest rates that remain temporarily unchanged at their lower bound, pushes up real interest rates and has a slightly negative indirect effect on economic activity in the core. This latter effect arises precisely as a result of exhaustion of the monetary stimulus, through further reductions in nominal interest rates, which occurs in the presence of a liquidity trap. In fact, in alternative simulations,<sup>12</sup> in which the central bank preserves its capacity to reduce interest rates, structural reforms in the periphery generate a positive effect in the neighbouring region.

SYNERGIES BETWEEN NATIONAL POLICIES AND MONETARY POLICY In order to analyse whether synergies may exist between the aforementioned national policies and monetary policy, a comparison is made between the effects of jointly implementing the two national policies considered above under two alternative reference scenarios: i) one in which no non-standard monetary policy measures are applied (i.e. the baseline scenario described in the second section), and ii) another in which the common monetary authority undertakes to keep the nominal interest rate at the lower bound for a longer period than would be consistent with its usual monetary policy rule.<sup>13</sup> In this way, the monetary authority implements a policy of forward guidance for the future path of monetary policy, like the one recently applied by the ECB.<sup>14</sup>

Chart 3 shows the effect of the national policy package under the two reference scenarios described in the previous paragraph. In the absence of forward guidance (blue lines), the combination of the two national policies has expansionary effects on the GDP and inflation of both sets of countries. When these measures are implemented simultaneously with an announcement by the central bank that interest rates will be kept low for a relatively long period (red lines), the expansionary effect of the same national policies increases appreciably; i.e. positive synergies are generated between these two sets of policies (national and monetary).

These synergies operate through various channels. First, as indicated above, the package of national policies has expansionary effects on economic activity in the medium and long term, especially as a result of the permanent positive effect of the structural reforms on activity in the periphery. In this context, a non-standard monetary policy, like the one considered here, which aims to produce a downward shift in the path of real interest rates, which agents use to discount future income flows, contributes to increasing the present value of future gains in activity and employment generated by the structural reforms, which boosts in turn the consumption and investment of households and firms in the short term.

Second, an expansionary fiscal policy in the core of the monetary union, which generates inflation in the area as a whole, helps to mitigate some of the deflationary effects associated with the introduction of structural reforms in the periphery. In this respect, the fiscal measure considered in this exercise helps to ease the constraints on monetary policy to provide anti-deflationary stimulus when its standard instrument (short-term interest rates) comes up against its lower bound.

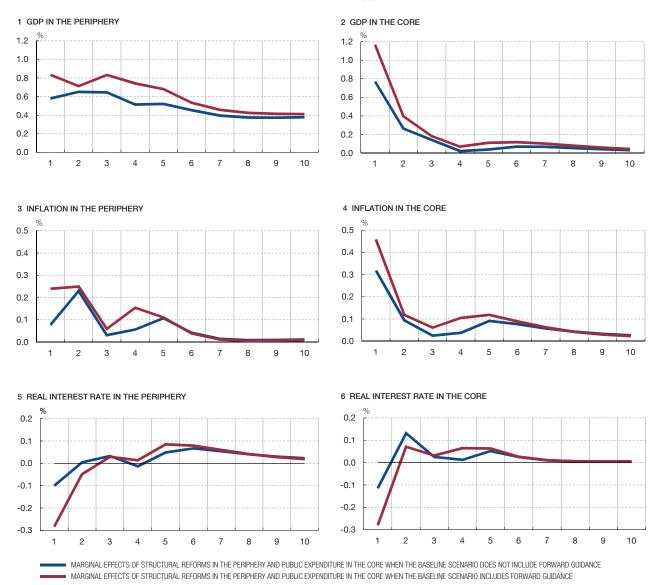

Finally, it should be noted that, in the absence of a non-standard monetary policy like the one considered here, national policies may affect the moment at which the central

<sup>12</sup> These simulations are not shown in these charts, but are available in Figure 4 of Ó. Arce, S. Hurtado and C. Thomas (2016), cited in Footnote 1 above.

<sup>13</sup> In the exercises presented below this additional period is assumed to be six months. The conventional monetary policy rule in the model is a Taylor rule, whereby the nominal interest rate rises when the inflation of the whole of the monetary union deviates from its long-term target.

<sup>14</sup> See B. Coeuré (2016), "The ECB's operational framework in post-crisis times", speech at the *Economic Policy Symposium*, 27 August 2016, Federal Reserve Bank of Kansas City.

# EFFECTS OF NATIONAL POLICY MEASURES IMPLEMENTED JOINTLY (a)

a Effects of structural reforms in the periphery and public expenditure in the core, with and without forward guidance in the baseline scenario. Deviations from the respective baseline scenario. Horizontal axis in years.

bank abandons the lower bound to nominal interest rates. Thus, a fiscal expansion in the core, through the inflationary pressure it generates, will tend to bring forward the moment at which the central bank begins to raise interest rates above their lower bound (see Chart 2.7, which compares the path of nominal rates in the baseline scenario with that which would exist with isolated national policies); this earlier rise in rates, in the absence of monetary measures conducive to a path of exceptionally low rates, would tend to partially counter the expansionary effect of the fiscal expansion.<sup>15</sup> By contrast, a commitment on the part of the central bank to keep the interest rate at its lower bound for a relatively prolonged period eliminates this moderating effect, boosting the

<sup>15</sup> See C. J. Erceg and J. Lindé (2014), "Is There a Fiscal Free Lunch in a Liquidity Trap?", *Journal of the European Economic Association*, 2 (1), pp. 73-107, for a detailed analysis of how, in a context in which standard monetary policy is constrained by the interest rate lower bound, fiscal expansions by the fiscal authority affect the moment at which the central bank abandons such lower bound.

expansionary effect of the fiscal stimulus and generating positive synergies between these two demand stimulating policies.<sup>16</sup>

Conclusions This article analyses the possible presence of synergies in the joint application of a nonstandard monetary policy geared to keeping interest rates at low levels for a relatively prolonged period, and demand and supply-side stimulus measures implemented by the national authorities of a monetary union.

For this purpose, a general equilibrium model of an asymmetrical monetary union is used, which enables a context of persistently low inflation in the monetary union as a whole with nominal interest rates constrained by their effective lower bound, like the one which currently characterises the euro area, to be reproduced.

The analysis conducted suggests that, in such a context, national stimulus policies (such as fiscal expansions in those members of the union with the necessary fiscal scope and structural reforms in those countries with less efficient markets and little fiscal scope) have greater expansionary effects on economic activity and inflation when, in parallel, the common central bank undertakes to keep interest rates on an unusually low path for a prolonged period. These results, therefore, suggest that the complexity of the current macro-financial environment of the euro area may be compatible with the existence of potentially significant positive synergies between the supply and demand-side policies of the different economic authorities.

17.10.2016.

<sup>16</sup> As can be seen in the Chart 2.7, structural reforms in the periphery, being deflationary, have the opposite effect to the fiscal expansion in the core, on the future path of nominal interest rates. However, their effect on the inflation of the monetary union is dominated by the inflationary impact of the fiscal expansion on the core, when the two national policies are considered jointly.

# REPORT ON THE LATIN AMERICAN ECONOMY: SECOND HALF OF 2016

Introduction

Despite the fact that the global financial markets evidenced marked instability in early 2016, the emerging markets, including those of Latin America, have moved on a favourable course since February. This trend has been characterised by a significant compression of risk premia, a considerable pick-up on stock markets and, on preliminary information for Q3, a return of capital flows as well. The main factor behind this change in sentiment was the fresh delay in the expected tightening of monetary policies in the main developed economies, a tendency which increased further to the United Kingdom's decision to abandon the European Union.

However, the GDP data for 2016 Q2 (the latest available) show a weaker performance in most Latin American countries than in previous quarters. Specifically, the weighted average of the GDP of the six main economies for which national accounts information is available showed a quarter-on-quarter decline in this period, leaving the year-on-year rate of change in 2016 H1 at -0.7%, following the stagnation (with an estimated rate of change of 0%) recorded in 2015. The loss of momentum in economic activity in Q2 was across the board, except in Brazil, where the decline in GDP eased.

It is still too early to conclude whether the high frequency indicators published as from Q3 – which point to an improvement in business and consumer confidence – augur, in combination with the recovery in capital flows towards the region in recent months, a turning point in terms of growth in Latin America. Indeed, the macroeconomic forecasts for the seven main economies (including Venezuela) as a whole point to growth of somewhat over 1.5% in 2017, after the decline of almost 1% estimated for 2016 (see Chart 1). However, this significant rise is due chiefly to the prospects of recovery in Brazil, which have been revised upwards by around 0.5 pp in the last six months, and which are associated with expectations of a change in economic policies that has yet to materialise. They also reflect the growth forecasts in Argentina, which show some downside risk.

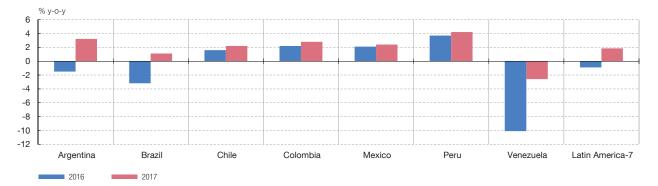

Several domestic factors support the prospect of recovery in the short term in the region. On one hand, the possible change of cycle of monetary policies owing to the decline in inflation and the appreciation of exchange rates. On the other, the correction of external imbalances in some countries, which should alleviate their vulnerability to changes in market sentiment. Both factors might further suggest a switch in the composition of growth in 2017 from net external demand – which has been underpinned by import substitution and by the moderate recovery in exports to date – towards investment. Conversely, among the factors posing downside risks to growth in the short term are the need for a fiscal adjustment, the decline in credit and the risk of capital flows being reversed, against the background of a change in sentiment on global financial markets.

On the external front, the risks stemming from China have eased in recent quarters, allowing some recovery in commodities prices (soya, copper and also oil) and an increase in the terms of trade in several countries in the region. Nonetheless, insofar as the stabilisation of growth in China has been largely based on greater credit stimulus, growth sustainability poses a latent risk. The ongoing normalisation of policy interest rates by the Federal Reserve adds a factor of risk on the markets, in addition to entailing a potential constraint on monetary policy measures in the region. Looking further ahead, fiscal consolidation in an

a September 2016 Consensus Forecasts projections.

environment of lower commodities earnings remains fundamental, as does too the challenge of diversifying economies in order to attain improved productivity levels.

This "Report on the Latin American economy" retains the change in structure first introduced into the previous edition, with an initial section offering an overview of recent developments in the Latin American economy, and two theme-based sections that look in depth at specific features of the economies in the region. The first theme selected for this report involves an analysis of the outlook for and risks to the Brazilian economy drawing on a VAR model, which allows growth to be broken down into its main determinants. The second theme-based section analyses the historical pattern of total factor productivity in Latin America and its determinants.<sup>1</sup>

# Recent developments in the Latin American economy

THE EXTERNAL ENVIRONMENT AND FINANCIAL MARKET DEVELOPMENTS The world economy continued to show signs of weakness in the period in 2016 covered by this report, growing at historically low rates and with the latest indicators failing to signal a significant rise in activity in any of the main areas. Global trade slowed in Q2, weighed down once more by trade in the emerging economies. Among the main advanced areas, the weakness of activity in the United States was to the fore in Q2, with growth lower than expected, as was the downward revision of the forecasts for the United Kingdom (albeit to a lesser extent than initially expected in the short term), following the vote against the country remaining in the European Union. International financial markets performed favourably from February (see Chart 2), when some of the factors that had borne down on developments at the start of the year were diluted. In particular, the risks of financial instability in China lessened as its growth rate stabilised, oil prices held at around \$40-50 per barrel and expectations of an imminent tightening in US monetary policy abated, adding to which was the further easing of the monetary policies of the ECB and the Bank of Japan.

The rise in financial asset prices on emerging and other high-risk market segments stepped up from end-June, following the rapid digestion by the markets of the unexpected UK vote

<sup>1</sup> The vector autoregressive model used in the section on Brazil has been estimated in collaboration with the European Central Bank. The section on productivity includes the main results arrived at in a paper by I. Kataryniuk and J. Martínez-Martín (2016), *TFP growth and commodity prices in Emerging Economies,* forthcoming in the Banco de España Working Papers series.

in favour of Brexit. Although this event was of a sufficient scale as to generate a fresh bout of global instability, on this occasion, following the adverse initial response, the response of the emerging markets was to rise strongly (see Chart 2) and portfolio investment inflows towards these economies ultimately exceeded those posted following the first two rounds

of quantitative easing in the United States. In an environment of low inflation and low growth in the industrialised countries, Brexit increased the expected accommodative stance for monetary policies in the euro area and the United Kingdom, and once more delayed expectations of monetary normalisation in the United States, giving rise to a process of widespread yield-search. This new scenario provides greater scope for the emerging economies to reduce their vulnerabilities, but also entails a higher risk of a rapid reversal of flows in the event of a return to risk-aversion on international markets.

The Latin American markets were not immune to these trends; indeed, the improvement was more marked than in other regions. Sovereign spreads narrowed by over 280 bp from their highs in mid-February, and the regional EMBI held at 460 bp (a similar level to that in May 2015), compared with declines of 110-120 bp in Asia and in Eastern Europe. Stock markets climbed by almost 30% (against 22% for Asia and 15% for Eastern Europe), driven by commodities firms, which on average posted rises of up to 80%.

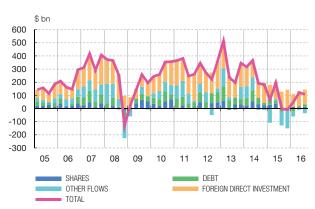

Country by country, the most notable development was the divergent path of the Brazilian and Mexican markets. Brazil has been one of the countries most to benefit from the context of risk-aversion on international markets, with a narrowing of 250 bp in its sovereign spread (from its high in February), stock market gains of 47% and a 25% appreciation in its currency against the dollar, the biggest among the emerging countries, ahead of Russia (20%) and Colombia (17%). In Mexico, by contrast, the sovereign spread narrowed by 85 bp, the stock market rose 11% and the peso depreciated by a further 4% against the dollar, to a historical low. This differentiated performance contrasts with the relative cyclical position of both economies, and with their fiscal situation. In Brazil, the expectation of a change in economic policy stance, the correction of the external imbalance and the recovery in confidence are playing a key role in shaping investor attitudes, while in Mexico's case doubts over medium-term growth, the external imbalance and, more recently, uncertainty over the results of the US presidential elections appear to have exerted a weightier influence.

In the other markets in the region, financial variables also performed positively and very similarly. The exception is Venezuela, where the sovereign spread continues to stand above its previous highs (2,200 bp), against the backdrop of a further worsening in activity, inflation and public finances, a fall in international currency reserves and an increase in social tensions, in light of the demand for a recall referendum against the presidency. Although the country has met payment of its external debt on schedule, in mid-September the State oil company PDVSA swapped debt maturing in 2017 (\$7.1 billion dollars) for new bonds maturing in three years, collateralised by assets of the US company, in an operation rated by two agencies as a selective default.

In step with the favourable performance of financial markets, capital flows towards emerging economies picked up in 2016 Q2 and Q3, as outflows under the portfolio investment and other flows headings (see Chart 3) came to a halt. Moreover, stock market inflows and debt outflows suggest a switch in composition towards higher-risk and less callable assets.

In Latin America, foreign direct investment inflows declined in the first half of the year to levels close to those in early 2010 (see Chart 3). Portfolio flows picked up strongly from Q2, as a result of the return of the Argentine government to the bond markets as from April. However, there were net outflows in both Brazil and Mexico, relating in both cases to non-resident public debt sales on local markets. On the first available estimates, capital flows

4 LATIN AMERICA: INTERNATIONAL MARKETS' FIXED-INCOME ISSUES

towards the region recovered in the summer months, as reflected by bond issues (see Chart 3), which grew 163% in 2016 Q3 compared with the same quarter in 2015, with issues by Brazil – which have been absent from these markets since March 2016 – to the fore. Most issues in Q3 were by the region's State-owned oil companies (37%) and governments (38%); euro-denominated issues, accounting for 41% of the total in Q1, virtually disappeared in Q2 and Q3 (1.1% and 2.1%).

ACTIVITY AND DEMAND The year-on-year rate of change of the aggregate GDP of the six Latin American countries<sup>2</sup> fell from -0.8% in Q1 to -0.7% in Q2 (see Table 1). Growth was generally lower than expected and with scant signs of recovery in activity up until the mid-point of the year. The stabilisation of the year-on-year rate in the first two quarters masks an easing of the decline in GDP in Brazil (from -5.4% year-on-year in Q1 to -3.8% in Q2), offset by the worsening of the recession in Argentina (from 0.4% to -3.4%). The remaining countries (Mexico, Chile, Colombia and Peru) also posted lower year-on-year growth in Q2. The seasonally adjusted quarterly change in GDP was negative in four of the countries analysed in Q2 – Argentina (-2.2%), Mexico (-0.2%), Chile (-0.4%) and Brazil (-0.6%) – and close to zero in Colombia and in Peru (see Chart 4).

<sup>2</sup> The aggregate analysed, excluding Venezuela, includes six countries: Brazil, Mexico, Argentina, Colombia, Peru and Chile.

b Mexico, Chile, Colombia and Peru.

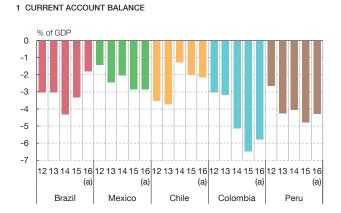

Several factors explain the underlying weakness in the region during the first half of 2016 (see below the section on Brazil for a more detailed analysis of this country's case). As regards Mexico, the loss of momentum of GDP in terms of its seasonally adjusted rate<sup>3</sup> was chiefly the outcome of the poor behaviour of the industrial sector, associated in turn with the sluggishness of US demand in the first half of the year. In Colombia, activity slowed to 2% year-on-year, 1 pp down on 2015 H2, showing the materialisation of the income effect associated with the strong decline in the terms of trade at end 2014, following a year of unexpectedly robust growth. In Chile, the fall-off in growth to 1.5% year-on-year is due above all to the natural resources sector, since the other sectors continued to grow at rates of 2.5%. Finally, the new GDP series for Argentina confirmed that the country has been in recession since late 2015, weighed down by the fall in investment and modest growth in private consumption.<sup>4</sup>

<sup>3</sup> The 2.5% year-on-year growth in Mexican GDP in Q2 translates into 1.5% in terms of the seasonally adjusted series, after adjusting for the Easter week calendar effect.

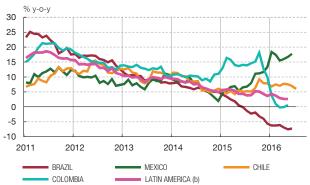

<sup>4</sup> The revision of the national accounts series from 2004 has meant real cumulative growth in the economy that is 17 pp down on that estimated previously over the past 10 years, offset, in nominal terms, by an upward adjustment of the deflator.

a Sum of four quarters to 2016 Q2

b Brazil, Chile, Colombia, Mexico and Peru.

c 2016 January-July average.

d Argentina, Brazil, Chile, Mexico and Peru.

e Brazil, Chile, Mexico and Peru.

Notable in the composition of regional growth in 2016 H1 is the role of external demand as the chief underpinning of growth (see Chart 4); that said, this was due above all to the decline in imports (-3.9% year-on-year), which fell for the third year running, and not so much to exports, the increase in which tended to ease (2.4% year-on-year), against the backdrop of appreciating currencies. Mexico, Chile and Colombia stood apart from this pattern, since the contribution of domestic demand to growth eased, but continued to outpace that of external demand.

From the standpoint of the domestic demand components, the fall in private consumption held at the regional average (-0.8% year-on-year in Q1 and Q2); however, this result was much influenced by the sharp adjustment in Brazil (where consumption fell by -5% year-on-year in Q2) and, to a lesser extent, in Argentina (-0.1% year-on-year), since in the remaining countries consumption increased, albeit more moderately so than in 2015 (Chile 1.7%, Mexico and Colombia 2.6%). The weakness of the labour market, which has been particularly marked in Brazil in the past two years, appears to have spread to some extent to other countries, as shown by the increase in the unemployment rate in Chile (to 7.1% of the labour force), Colombia (close to 10%) and Peru (7%) (see Chart 5).

In terms of the regional average, investment continued to decline (-4.1% year-on-year in Q2), the main cause being the weakness of domestic demand in the region. However, the less adverse performance in Brazil and the stabilisation in Mexico and in Chile might be signalling a turning point in Q2 which, along with the latest confidence indicators (see Chart 5), would suggest a more positive outlook ahead of 2017, albeit still with major risks. Domestic credit to the private sector trended unevenly from country to country, with a decline of over 5% in real terms in Brazil, a very strong slowdown in Colombia and, by contrast, very high growth of over 10% in Mexico, where the substitution of domestic for foreign financing appears to be combining with the effect of the financial liberalisation agenda.

On the external front, the current account deficit of the region as a whole continued to decline, to stand below 2.7% of GDP (see Chart 5). This was the outcome, above all, of the reduction in imports associated with the adjustment of domestic demand and with the currency depreciation. The recovery in exports was, as earlier indicated, much more modest, against a rather unfavourable international background, which poses certain doubts about the sustainability of the external adjustment if a recovery in domestic demand takes place. The adjustment of the external balance in Brazil was particularly significant (to -1.8% of GDP), while in Chile it remained relatively under control (at around -2.1%), with a slight deterioration in recent months. In Colombia the current deficit fell to -4.8% in 2016 Q2, after having drawn close to -7% of GDP at end-2015, and to -4.3% in Peru. In Mexico the current deficit held at 3% of GDP, after widening by 1 pp in 2015 as a result of the decline in oil exports.

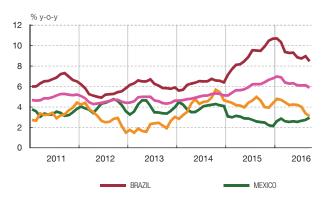

Short-term forecasting models point to a mixed picture for Q3. Activity in Mexico is expected to pick up somewhat; yet this does not avert a downward revision of forecasts for the year as a whole. In Argentina, the figures would suggest flat GDP, whereby the forecast for the year as a whole would move clearly into negative territory. Weak growth is expected for Chile in Q3, strengthening towards the end of the year, and in Brazil activity will tend to stabilise, after the decline in the first half of the year, but the pick-up in activity is expected to be delayed to Q4.

POLICIES AND OUTLOOK Inflation in the region in the past six months has been moving on a downward trend, albeit at a slower-than-expected pace. The weighted average of inflation in the five countries pursuing inflation targeting stood in September at 5.9% year-on-year, 0.8 pp less than at the start of the year, with significant differences from country to country (see Chart 6). Brazil and Colombia posted respective rates of 8.5% and 7.3% in September, still far above their central banks' targets, while in Mexico, Peru and Chile inflation stood at 3%, 3.1% and 3.1% year-on-year, respectively, within the target ranges in all cases. In Argentina, the new official price index, first published in June, posted monthly inflation of 2% that month, although it has since eased temporarily (1.1% month-on-month in September), as a result of the suspended rise in certain regulated prices.

Monetary policies have reacted in a differentiated manner. In Brazil, despite the gradual easing in inflation expectations since early 2016, the need to reinforce the credibility of the 4.5% target led the central bank to delay until mid-October the cut to its policy interest rate, which has dipped to 14% from 14.25% (see Chart 6). The market continues to discount a cut to official policy rates, and more markedly so next year, as inflation expectations return to target (see Table 2). The situation in Mexico is, to some extent, the opposite; despite the stability of below-target inflation during the past six months and the anchoring of expectations, the Mexican central bank raised interest rates by 50 bp at end-July, immediately after Brexit, and by a further 50 bp in September, to 4.75%. The sharp depreciation of the Mexican peso, the failure to correct the current deficit and, more recently, the perception of greater risk associated

with the possible outcome of the US presidential elections have tilted the balance in favour of a preventive tightening of monetary policy. The Colombian central bank sharply raised its policy interest rate (350 bp in two years, to 7.75% at end-July), until inflation reached a turning point; however, headline inflation (and core inflation) is still far above the target range, owing to the influence of adverse climate-related factors and to the depreciation of the currency. Finally, interest rates in Chile and in Peru have not been altered in the past six months.

4 REAL PRIMARY REVENUE AND EXPENDITURE IN LATIN AMERICA (b)

SOURCE: Datastream.

a Four-quarter cumulative data to 2016 Q2.

b Aggregate of Brazil, Chile, Colombia, Mexico and Peru.

In Argentina, monetary policy has eased in line with the improvement in inflation expectations, and its policy interest rates have fallen from 38% in May to 26.75% in September. The introduction of inflation targeting is scheduled for early 2017, with a range between 12% and 17% for this year, which seems fairly demanding; hereafter, there is expected to be a period of progressive reduction in targets, converging on figures of around 5% in 2019.

In the fiscal policy realm, both the cyclical situation and the lack of decisive measures for consolidation or the preference for a gradual fiscal adjustment have led to fiscal deficits being redressed only very moderately during 2016 (see Chart 7). Indeed, leaving aside Brazil's situation, which is addressed in greater depth in the following section, only in Mexico was there a very significant reduction in the budget deficit in the first half of 2016. In the region on average, public revenue continued to decline, although the rate appears to be stabilising, following the strong fall in 2015, and the growth of expenditure has eased. Against this background, and following Brazil's downgrading by one of the agencies in May (to BB), Brazil's credit rating, and that of Colombia and Mexico, have been placed on negative watch by the rating agencies. Budget plans confirm a maintenance of the gradual consolidation effort in 2017.

Country by country, the fiscal consolidation strategy in Argentina, which envisaged a gradual adjustment (primary deficit of 4.8% of GDP in 2016), is encountering difficulties, including most notably the courts' decision to suspend the increases in gas tariffs, which will temporarily reduce revenues; further, the commitments to revalue pensions and establish a minimum non-contributory pension will have permanent effects on spending which, it is forecast, will be offset by a programme of incentives to disclose wealth abroad. For these reasons, the primary deficit target for 2017 has been revised upwards in September, to 4.2% of GDP. Mexico has submitted to Congress a budget for 2017 with a primary surplus of 0.4%, higher than initially announced, which would be the first positive balance since 2008. Should the target be met, it would enable the budget deficit to be reduced from the expected figure of 3% in 2016 to 2.4% in 2017, with an expenditure cut falling on PEMEX, and provide for the stabilisation of public debt, whose weight in GDP has increased significantly in recent years.

In Colombia, the deficit has widened in recent years to the figure of 3.9% forecast for 2016 as a result of the fall in oil prices. While the mechanistic application of the fiscal rule would allow a deficit of 4% in 2017 and 3.2% in 2018, the Consultative Committee for the fiscal rule limited the deficit for these same years to 3.3% and 2.7%, with a 6.6% increase in spending in 2017. The Government intends to offset the decline in oil revenues by increasing other taxes, probably VAT, although these measures are pending approval. The Chilean government will unveil its 2017 budget in the coming weeks, influenced by the end-2016 deficit of around 3.2% (which entails a deterioration of over 3 pp in three years), maintaining the commitment to progressively reduce the structural deficit by 0.25% each year (1.4% in 2017). Accordingly, the budget for 2017 is expected to be relatively restrictive, with spending growth below 3% in real terms. Finally, the fiscal targets in Peru for 2016 (3%) and 2017 (2.2%) have been eased somewhat, and the budget for the coming year envisages a nominal increase in spending of 4.7%.

The outlook for the region points to a very moderate recovery in growth, with most considerable cross-country heterogeneity. In Venezuela, the recession will deepen and in Brazil very low growth is expected, while in Mexico, Chile, Colombia and Peru growth rates above 2.5% are forecast. Inflation is broadly projected to decline to target range levels. The balance of risks appears tilted to the downside regarding both the external and domestic outlook. External risks notably include the possibility of a reversal in capital inflows, in a context of changing market sentiment. New stresses may also emerge in China's rebalancing process, posing difficulties owing to the systemic nature of this economy. Domestically, the main risks involve the greater-than-expected impact of fiscal consolidation measures on economic growth and of the slowdown in credit.

# Brazil: recent developments and change in economic policies

This section analyses the outlook and risks facing the Brazilian economy following the recent change in government, focusing particularly on the fiscal situation, which is the main short-term challenge.

From 2004 to 2008, Brazil's economic growth far outpaced its historical average. At the same time, its social indicators improved significantly<sup>5</sup>, as a result of the application of social inclusion policies. This growth was decisively underpinned by a favourable external environment, including the upward cycle of commodities, and by better macroeconomic policy management. This latter factor meant that, following the outbreak of the global

<sup>5</sup> From 2004 to 2008, GDP growth averaged 5%, meaning per capita GDP increased by 20%. During this period the poverty rate fell by half, the weight of the middle classes increased by 15 pp and the Gini index fell by over 6 pp.

financial crisis, Brazil had for the first time sufficient fiscal room to pursue a countercyclical policy, leading to a swift recovery in activity in 2010.

However, during the boom period the economy's structural weaknesses were not addressed (the obsolescence of labour market laws, tariffs, high start-up costs for new businesses and an overly complex tax system), which prompted low productivity growth; moreover, a series of fiscal rules were introduced that made it very difficult to adjust public spending. Compounding this were the expansionary economic policy responses from late 2011, which served only to exacerbate the imbalances<sup>6</sup>, without managing to boost growth, in a setting in which financial markets also failed to exert any disciplining effect.<sup>7</sup>

The change in expectations about US monetary policy in May 2013 singularly affected the Brazilian markets, highlighting the external and fiscal vulnerabilities that had built up previously (see Box 1 on the financial stress index depicted in Chart 8). The change in economic policy stance after the presidential elections in late 2014, with a more restrictive bias, led to a strong contraction in activity that worsened the country's situation and exacerbated the tensions on Brazilian markets. These tensions peaked in early 2016, against the background of the deepening political crisis which culminated with the president's removal from office at the end of August. However, since April expectations of a change in government and in the economic policies applied, along with an external environment of widespread yield-search, have provided for a strong recovery in confidence indicators and in the Brazilian financial markets.

In the first two quarters of 2016, GDP fell once more (-0.4% and -0.6% quarter-on-quarter, respectively), confirming that in 2015-2016 Brazil will post the worst recession since 1980 (see Chart 8). Activity has been weighed down above all by private consumption (with quarterly declines of -1.3% and -0.7% in the first half of 2016), offset in part by an acceptable export performance and, more recently, by the incipient pick-up in investment, which increased in Q2 for the first time since 2013 (0.4%). High-frequency indicators for Q3 are in general favourable, although most of them are qualitative. Indeed, the labour market situation has continued to worsen, with year-on-year declines in employment of 1.5% since the start of the year and increases in the unemployment rate to 11.8% in August (a 12-year high). Likewise, lending to firms declined – even in nominal terms – in Q2, and Brazilian companies reduced their debt issues on international markets, while Petrobras announced new divestments and expenditure cuts.

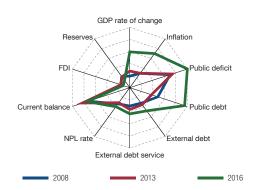

Inflation has fallen from its end-2015 high – when it rose to 10.7% – to around 8.5% yearon-year, but it has done so at a slower-than-expected pace, which has delayed the easing of monetary policy until October. The downward stickiness is centred on tradable goods prices, driven by the depreciation of the real until January 2016, and on a lower-thanforecast decline in regulated prices. Finally, the adjustment of the current account deficit is proving very swift (from a high of -4.5% of GDP in 2015 to -1.8% in mid-2016), owing to the improvement in the trade balance (which has moved from a deficit of 0.2% to a surplus of 2.5%).

<sup>6</sup> These measures included aggressive cuts to the policy interest rate, corporate income tax exemptions and a 3 pp rise in permanent expenditure; and an expansion of BNDES-subsidised loans.

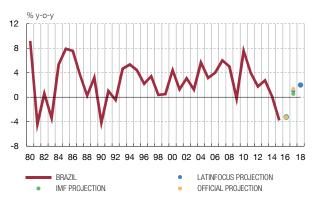

<sup>7</sup> Brazil had capital inflows totalling 9% of GDP annually, which fuelled a strong appreciation of the currency that reduced external competitiveness. Industrial production flattened and consumption surged, meaning that the current account deficit widened from 1.7% of GDP in 2009 to 4.5% in 2015.

5 PUBLIC REVENUE AND SPENDING

b Estimates.

The decomposition of the Brazilian economy's growth determinants with the help of a BVAR<sup>8</sup> econometric model enables these effects to be quantified (see Chart 9). As can be seen, the expansionary policy contributed substantially to the exit from the crisis as from

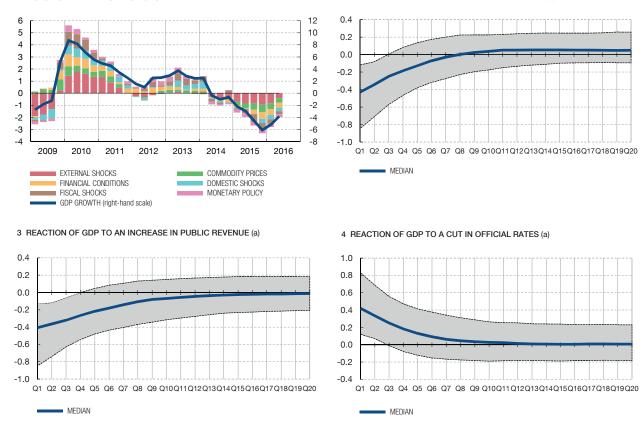

<sup>8</sup> The model, estimated in collaboration with the ECB, includes seven variables (external demand, non-energy commodities prices, the financial stress index described in Box 1, GDP, public spending and revenue as a percentage of GDP, the inflation rate and the policy interest rate); the first two variables are considered to be exogenous. The effect of the segmentation of the credit market is not included for the moment. The model has been estimated with quarterly data since 2002 Q1 and includes sign restrictions so as to be able to identify structural shocks.

#### BRAZIL

#### CHART 9

#### 2 REACTION OF GDP TO A CUT IN PUBLIC SPENDING (a)

SOURCES: ECB and national statistics.

a Reaction of the year-on-year rate of change in GDP to a one unit shock in each variable (one point of GDP for public revenue and spending, 1% for the interest rate).

2009, with the favourable external conditions playing an equally significant role.<sup>9</sup> According to this analysis, the slowdown in activity from 2011 was the outcome of the collapse of the contribution of external demand and of commodities prices, while the economic policy response scarcely impacted growth. The current recession might be explained to a greater extent by external factors (commodities prices and other shocks), along with the rise in the cost of external financing conditions, although also by domestic factors, including the tightening of monetary policy.

THE FISCAL PROBLEM AND THE NEW GOVERNMENT'S CHANGE IN STRATEGY In 2016 to date, public finances have further worsened, meaning that the primary deficit stood at 2.8% of GDP in August (compared with the surplus of 3% of GDP in 2008), although the total deficit dipped from 11% to 9.6% of GDP from January to August, thanks to lower debt servicing payments (see Chart 8). The pattern of public revenue and spending has remained unchanged, with revenue falling almost 5% in real terms and expenditure outpacing inflation, owing above all to compulsory expenditure<sup>10</sup>, and despite the contraction in investment expenditure.

<sup>9</sup> The effect of commodities prices is limited, given that Brazil is a relatively closed economy (exports account for only 11.3% of GDP), and where soya and iron ore (its main commodities exports) represent only 20% of the export basket.

<sup>10</sup> This heading includes Social Security (including pensions), civil servants' wages, unemployment benefits and non-contributory pensions.

Brazil's fiscal problem, at the root of which are budgeting rules for many expenditure items that give rise to a clear bias towards inflexibility irrespective of the cycle<sup>11</sup>, has been exacerbated by the strong cyclical decline in revenue, owing to the recession (see Chart 8). Most of the increase in primary expenditure between 2011 and 2015 (2.9 pp of GDP) was concentrated in so-called "compulsory expenditure" (2.7 pp of GDP<sup>12</sup>; see Chart 5) and demographic factors (an increase in the population aged over 65, reduction in thresholds for income to gain access to social programmes, etc.), but also the relaxing of eligibility criteria and the increase in the amounts for programmes. The indexing of some programmes to the minimum wage (pensions and non-contributory pensions) or to fiscal revenues (education and health) has been particularly significant in this respect.<sup>13</sup> Indexing to the minimum wage has added strongly upward inertia to these expenditure items, given that the increase therein is governed by 2011 legislation aimed at raising the purchasing power of the minimum wage, and not only at compensating for inflation erosion of such power.<sup>14</sup>

Given the negative trend of activity and of the primary balance in recent years, gross public debt has increased to a historical high (70.1% in August). Despite its composition (in the main fixed-rate or inflation-linked) and attendant maturities (which have been lengthened compared with those of the past), the proportion of floating-interest-rate or short-term debt meant that the interest burden surged in 2014 and 2015 as a result of the tightening of monetary policy and that the deficit rose above 9% of GDP at the start of 2016. This, along with the recession, raised doubts about fiscal sustainability (see Chart 8).

Against this backdrop, the new Government appointed in May 2016 opted for a change in fiscal management, acknowledging firstly the structural source of the problem. It duly proposed a constitutional amendment (PEC 241) to limit the growth of nominal primary expenditure to that of the previous year's inflation (entailing zero real growth) for 20 years, revisable after 10 years.<sup>15</sup> In addition, Congress was persuaded to approve the release of 30% of tax revenue whose end-use had been predetermined in order to increase budgetary flexibility. Secondly, the new expenditure-containment policy was extended to the regions, through a law that imposes a spending freeze in real terms in exchange for debt relief.<sup>16</sup> Thirdly, priority has been given to a gradual adjustment of the fiscal balance, so that a primary deficit of 2% of GDP has been budgeted for 2017, 0.5 pp down on 2016. The 2017 figure would be achieved by means of the disposal of State assets, the granting of concessions for new infrastructure<sup>17</sup> and higher growth in activity (1.6%, compared

<sup>11</sup> It was estimated that around 85% of the primary expenditure budget was inflexible in 2015.

<sup>12</sup> Of this figure, 0.7 pp relate to the recognition of obligations that were on the balance sheets of State-owned banks and which were consolidated in 2015, at the root of the political trial of President Rouseff.

<sup>13</sup> Since 2011 a minimum of 10% of Treasury revenue, 12% of regional funds and a further 15% of local municipal funds have been earmarked for health spending, while the funding of the education system is regulated by the Constitution, which stipulates that a minimum of 18% of federal revenue and 25% of regional and local funds be assigned to education.

<sup>14</sup> The increase in the minimum wage is calculated on the basis of the previous year's inflation and the GDP growth of two years earlier.

<sup>15</sup> The Ministry of Finance has stated that the application of the cap to health and education expenditure will be postponed until 2018. Certain strategic expenditure items, such as regional and local transfers and the contributions to the Basic Education Development Fund, are excluded.

<sup>16</sup> The regional and local governments show balanced accounts, although these have worsened greatly since the surpluses of close to 0.4% of GDP in 2013-2014. Certain regions are in a very delicate financial position, such as Río de Janeiro, which was declared to be in selective default after failing to meet a payment of \$46 million to the IDB. Other regions have stopped paying their civil servants owing to a lack of revenue.

<sup>17</sup> In mid-September the government unveiled its *Crecer* (Growth) programme, which amends the rules governing concessions for infrastructure, public services and mining operations, eliminating the need for the public corporation of each sector to have a minimum share in the concession. Consideration is also being given to the sale of lotteries, public energy utilities and sanitation corporations in certain cities.

with the previously estimated figure of 1.2%); in 2018, the primary deficit would be 0.9% of GDP and only in 2019 would a primary surplus be attained (0.2%). Increasing taxes is considered only as a last resort, since taxation is already fairly high for a country of Brazil's characteristics (34.4% compared with 32.5% in Turkey or 26.8% in Korea).

This new strategy has been well received by both international and local investors. Indicators of credit risk and stock market indices recovered proportionately more than in the rest of Latin America, and financial tensions moved on a declining trend from mid-April 2016, which quickened as from August, reaching a 10-year low (see Chart 8).

Nonetheless, the strategy is not free from risks. First, if the freeze on spending in real terms were not to obtain parliamentary support beyond the 2017 budget, there would be a loss of credibility in the proposed economic programme.<sup>18</sup> Second, the adjustment largely rests on a forecast pick-up in activity and in tax revenue-raising in 2017 which might not materialise, and on a programme of privatisations and concessions that calls for continuing favourable market conditions. Third, public debt dynamics remain a concern and, according to the draft budget submitted to Congress, in the best of cases it would stabilise at around 80% of GDP around 2021, which shows the Government's limited room for manoeuvre in the face of potential shocks (see Chart 8). Lastly, one of the key reforms for stabilising public finances in the long term, namely the reform of the public pensions system, the text for which will not be discussed in Congress until 2017, is politically very sensitive. Without reform, the official projections show that Social Security spending would rise from 8% to 17.2% in the next 50 years, making funding thereof impossible. The first necessary step would involve setting a minimum retirement age; currently, the average effective retirement age is around 52 years. Decoupling from the minimum wage would be made easier if Congress were finally to approve PEC 241.

Lastly, given the fragile support in Parliament and the context of raised social militancy, the government has postponed the consideration of other necessary structural reforms to raise medium-term productivity, in areas such as the labour market, tariffs, business startup costs and the reform of the tax system.

What effects will the fiscal adjustment designed have on activity? The impulse-response functions derived from the previously presented model (depicted in Chart 9) show that a reduction in spending of approximately 1 pp of GDP would reduce growth in a range of 0.2 to 0.5 pp in the initial years, thereby indicating a low fiscal multiplier. If, simultaneously, the government were to find itself obliged to raise revenue by 1 pp of GDP, the additional effect would be a fall of between 0.3 and 0.5 pp in the growth rate. However, the estimated effect of this fiscal adjustment would be small if monetary policy were more expansionary and the monetary authorities were to cut the policy interest rate more aggressively, moves which, according to the model, could raise the growth rate by between 0.2 and 0.5 pp in the first two years; likewise, an improvement in external funding conditions would also ease the effects of a more contractionary fiscal policy. In sum, the adjustment strategy chosen by the Government (a reduction in spending as a proportion of GDP of 0.4 pp for 2017 and, in the medium term, by means of a constitutional amendment) would have moderate unfavourable effects on GDP which, moreover, might be offset if domestic and external financial conditions improve in the coming months.

<sup>18</sup> In this connection, the first Congress vote on PEC 241 had been approved in mid-October.

Productivity in Latin America following the end of the commodities "super cycle" In recent years, many emerging economies have seen a downward revision in their potential growth. The adjustment is proving particularly significant in commodities-exporting economies, whose dynamism has been dented not only by the weakness of the world economy and, in some cases, by growing financing costs, but also by the sizeable fall in commodities prices since 2011. This situation has resulted in a decline in investment in these economies and, therefore, in a slower pace of capital accumulation. Against this background, the economic literature has shown how, once the growth associated with factor accumulation (the labour and capital factors alike) reaches its limit, the main engine of economic growth lies in productivity gains.<sup>19</sup>

In the past 30 years, the Latin American economies have broadly maintained moderate growth rates, associated more with capital or labour accumulation than with productivity gains, which has restricted the region's capacity to converge towards higher living standards. As part of this general pattern, the period of strong increases in commodities prices in the first decade of this century was an exception, since during these years the pace of growth in the region rose significantly – as did the speed of convergence – without a correlative increase in the pace of factor accumulation.<sup>20</sup> Subsequently, total factor productivity (TFP) has returned to a flat line in certain Latin American countries (see Chart 10), this being the main cause underlying the downward revision of the region's growth.<sup>21</sup>

This section analyses productivity in Latin America, with the aim of explaining the causes behind recent developments, quantitatively identifying the contribution of temporary and permanent factors. The country-by-country breakdown in Chart 10.1 shows that, despite the different levels of development in the region (suggesting divergences in productivity growth from country to country would be expected), the average increase in productivity has been relatively low in all of them, compared, for example, with emerging Asia. Conversely, the increase in productivity from 2003 to 2008 was on average higher, but also more uneven from country to country; particularly of note is Mexico's flatness. Given that this behaviour coincides with different commodities price phases, with commodities being one of the main exports in many of these countries, it is worth considering whether there is a relationship between both phenomena.

Traditionally, the effect on potential growth of a greater dependence on natural resources has been deemed negative<sup>22</sup> (an effect known as "Dutch disease"<sup>23</sup>). However, recent studies have called this view into question<sup>24</sup>, highlighting the fact that under certain circumstances – especially better institutional quality – the positive effects may prevail over the adverse ones, especially in the short run. In this respect, the short-term correlation between productivity growth and commodities prices has proven particularly high in Latin

<sup>19</sup> W. Easterly and R. Levine (2001), "What have we learned from a decade of empirical research on growth? It's Not Factor Accumulation: Stylized Facts and Growth Models", World Bank Economic Review, 15 (2), pp. 177-219.

America in recent years (see Chart 10.2). Thus, the strong growth phase in commodities prices since the start of the last decade – the so-called commodities "super cycle" – coincided with a period of productivity gains, whereas after the crisis both variables have remained weak. Mexico's zero productivity growth in this period would, with the Mexican economy being geared towards manufacturing exports, be consistent with lower dependence on commodities than the other countries analysed.

Among the possible causes of this positive correlation, some structural and other conjunctural reasons have been cited. Among the former, an increase in commodities prices might ease financing conditions, allowing fresh investment in innovation or human capital, which enable the diversification of the economy to be increased and citizens' level of educational attainment to be raised. Further, enhanced institutions and the stabilisation of the economies in the past twenty years — through, for example, the adoption of fiscal rules, the introduction of inflation-targeting and the creation of sovereign funds – may have been instrumental in mitigating the adverse effects of "Dutch disease".<sup>25</sup> Among the conjunctural reasons, the possible complementary effects of commodities production on other sectors of the economy have been cited<sup>26</sup>, whereby an increase in commodities prices might mean greater use in the

<sup>25</sup> J. Frankel (2012), "The natural resource curse: A survey of diagnoses and some prescriptions», in R. Arezki, C. Pattillo, M. Quintyn and. M. Zhu (eds.), Commodity Price Volatility and Inclusive Growth in Low-Income Countries, International Monetary Fund.

short term of the factors of production. Moreover, another possible cause involves a question of measurement; if the production function considered to estimate productivity does not include the endowment of natural resources, a greater use of the latter would be reflected in higher TFP, as the factor is obtained residually.

To analyse these matters, an empirical model has been estimated for TFP. It includes, in addition to commodities prices, other more traditional explanatory factors using data from 43 economies over the 1993-2014 period. Included among these determinants are structural aspects of economies (technological innovation, institutional quality, trade openness and technological absorption, which depends on the level of educational attainment) and temporary aspects (the output gap and capacity utilisation of economies).

The main conclusion of this exercise is that the positive impact of the changes in commodities prices on productivity is robust to different econometric specifications and to the presence of country-specific effects. Conversely, the level of commodities prices does not prove significant. Therefore, in the short run, changes in commodities prices play a key role in the economies that export these products, which adds to the habitual procyclical behaviour of productivity. The temporary nature of the effect of commodities prices appears to support the presence of agglomeration effects in the short term that involve a greater use of factors of production or the use of factors of production not included in the measurement of productivity, such as natural resources.

It is worth noting that, although the effect of commodities prices on productivity is confined to changes in the short term, the lasting nature of commodities price cycles means that the effect relates to relatively long periods of productivity growth in Latin America. Chart 11.1 shows the average growth of TFP in Latin America once the temporary factors of the economic cycle and commodities prices are stripped out, or, otherwise expressed, what TFP growth would have been in a scenario involving the long-term stability of these variables.<sup>27</sup> It can be seen in the chart that over half of the increase in TFP in Latin America in the 2003-2008 period was attributable to the sustained increase in commodities prices and a favourable economic cycle which, at least in part, was the outcome of the behaviour of the prices of these products.

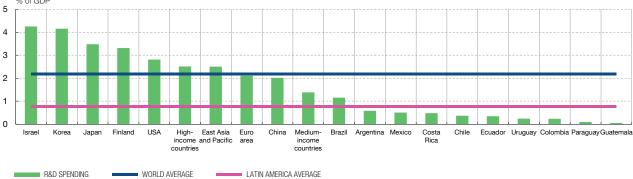

In the present circumstances, the challenge for Latin America lies in improving those structural aspects that may boost its competitiveness and, thereby, raise the level of productivity against a background of lower commodities prices than in recent years. The exercise performed shows that, in the long term, productivity growth will be determined by economies' capacity to incorporate new technologies into capital and by the speed of convergence towards the knowledge frontier. For improvement in these areas, two avenues must be pursued. First, an improvement in the level of educational attainment is related to a swift pace of technological absorption. Hence, simulating a counterfactual scenario, Latin America could raise annual productivity growth by around 0.4 pp if its working population were to achieve the percentage of secondary education completion posted in China. In this connection, secondary education must be extended to more layers of society. In addition, the region must improve its quality in view of the results obtained in the programme for international student assessment (PISA) report (see Chart 11.2).<sup>28</sup>

<sup>27</sup> For further details see I. Kataryniuk and J. Martínez-Martín (2016), *TFP growth and commodity prices in Emerging Economies*, Documentos de Trabajo, Banco de España (forthcoming).

Investment in research and development (R+D) and the incorporation of new technologies are vital factors for increasing the complexity of manufacturing products and thus obtaining substantial returns in terms of productivity growth. In this respect, average investment in innovation in Latin America continues to be far below the global average (see Chart 11.3), meaning there is more than ample scope for improving on current levels. According to the results of the exercise, if investment in innovation in the region were to increase by 1 pp, drawing closer to the global average, there would be a 0.3 pp increase in productivity growth.

Science

When analysing financial tensions faced by a country, the individual indicators usually used relate to specific markets or funding sources that do not always behave in the same manner, making it difficult to arrive at a common diagnosis. To avoid this, financial stress indices (FSIs) that seek to group the signals from a broad set of market variables into a single indicator have recently become popular.<sup>1</sup> This box shows an FSI for Brazil, based on 18 indicators of 6 market segments (stock exchange, public and private debt, banks, money markets, exchange rates and commodities prices) deemed significant for the Brazilian economy. The index aggregates these indicators taking into account crosscorrelations between them.<sup>2</sup> The 18 variables used in the Brazilian FSI are listed in the table below.

As Chart 8.2 shows, the FSI for Brazil increased substantially both in the summer of 2002 (market turmoil following the first victory of the PT party) and in September 2008, the two documented crises Brazil underwent. More recently the Brazilian FSI shows, after the peak recorded when political problems were rampant, a clear decline in tensions commencing early 2016 and becoming more marked after the country's political crisis was resolved, to lows not seen since 2006.

# Table

<sup>1</sup> See D. Hollo, M. Kremer and M. Lo Duca (2012), CISS - A composite indicator of systemic stress in the financial system, ECB Working Papers 1426.

<sup>2</sup> This correction takes into account the fact that in periods of tension the sub-indices are highly correlated, whereas in periods of calm the correlation would be lower; accordingly, an unadjusted FSI could overestimate stress during calm times.

# ISLAMIC FINANCE: DEVELOPMENTS AND OUTLOOK

The authors of this article are Isabel Garrido, María Méndez and Pablo Moreno, from the Associate Directorate General International Affairs.

Islamic finance encompasses instruments and institutions governed by Islamic law or the Shari'ah, which implies that most assets take the form of contracts linked to an underlying asset. In recent years, Islamic finance has grown significantly, outpacing conventional finance, driven by the rise of emerging economies with Islamic jurisdictions, its gradual internationalisation, and the rising demand among the Muslim population worldwide, which has very low rates of access to and use of bank services. The future development of Islamic finance will require qualitative changes in terms of aligning its regulatory and supervisory standards to the reference Basel regulatory framework.

Islamic finance includes all financial institutions and instruments that comply with the precepts of the Shari'ah or Islamic law, which establishes three main requirements for financial transactions: they should be free of interest (riba), based on real assets, and should not fund activities considered to be harmful (haram), such as gambling or the production and sale of alcohol or pork products. The Shari'ah law also establishes a set of principles, such as the prohibition of excessive risk-taking (gharar) or speculation (masyr), or the requirement that transactions are based on fair prices, entail no risk and include the right to equal and appropriate information and cooperation between contracting parties.

> Over the past decade, Islamic finance has expanded notably, posting double-digit rates, diversifying products and institutions and gradually gaining market penetration internationally. Currently, the Islamic financial sector is no longer confined to the Muslim population and is present in "secular" countries, including in several European Union countries. However, its future poses a series of challenges, particularly in terms of regulatory heterogeneity and adaptation to the regulatory framework of conventional financial jurisdictions. This article addresses the main features of Islamic finance, its recent developments and current situation, and the regulatory challenges ahead.

Main features of Islamic Subject to the general requirements and principles described in the introduction, the finance design and configuration of specific Islamic finance instruments provide for a certain degree of discretion, depending on the jurisdiction. The biggest component of the Islamic finance sector is banking (close to 80% of total Islamic financial assets), followed by the Islamic bond or sukuk, which accounts for 16%. Islamic banking instruments largely take the form of contracts linked to an underlying asset, generally goods, services or shares. There are two main types of contracts: those based on purchase and sale transactions with a mark-up, mostly used for short and medium term financing; and those based on a profit-and-loss sharing structure in which the bank bears part of the transaction risk. Financial gains (which are permitted provided that they do not take the form of interest) are linked to the value of the underlying asset. Table 1 summarises the main instruments for each of these groups.

> On the liabilities side (see Table 2), the "deposits" take the form of investment accounts, where profitability is determined ex post depending on the bank's profitability or that of the specific underlying assets (usually mudarabah contracts). These accounts may be

## Introduction

## KEY INSTRUMENTS OF ISLAMIC FINANCE

Mark-up contracts. «Loans» take the form of asset purchase transactions by the financial institution and resale/leasing of assets to the customer, on the basis of deferred payment

| Murabah | The bank purchases the asset at the request of the customer, and resells it to the latter at a mark-up and with deferred payment.<br>The contract establishes the price and the form of payment, whether deferred over a period of time or in a single bullet payment. Any<br>losses are borne by the capital provider (the bank), not the entrepreneur (unless the latter's negligence can be proved). |
|---------|---|
| Salam   | The buyer (bank) makes a spot payment, under the promise of receiving specific goods from the seller (customer) at a future date (deferred delivery). Mainly used in agricultural financing.  |
| Istisna | Similar to salam, this is a contract in which an asset can be purchased before it comes into existence, with an obligation on the part of the customer to manufacture and deliver it at a future date. It is used in long-term project financing.   |
| ljarah  | Leasing of a tangible asset or services for a specified period, with a right to purchase (similar to leasing in conventional banking). The owner of the asset (the bank) bears the full risk associated with ownership.   |

Profit-and-loss sharing contracts, in which the bank bears part of the risk

| Mudarabah  | The bank contributes capital for the project and the other party contributes the work. Profits are shared, but losses are borne entirely |
|------------|--|
|            | by the lender (the bank or investor) and not by the entrepreneur (unless the latter's negligence can be proved).                         |
| Musharakah | Contract of joint partnership, in which both profits and losses are shared. Both parties provide capital to finance the project.         |

restricted or unrestricted, depending on whether the bank has limitations on the type of investment it can make with the deposit-holder's funds. The liabilities side also includes interest-free current accounts, for which the bank acts solely as a custodian or safekeeper, returning 100% of the deposit (*wadiah o amanah*),<sup>1</sup> and conventional capital instruments.

Unlike conventional bonds which are debt instruments, the *sukuk* represents partial ownership of a share, a real asset or a service (bringing it closer to asset-backed securities, ABS).<sup>2</sup> The principal is not usually guaranteed, and profitability is determined on the basis of the profitability of the underlying asset. *Sukuk* bonds can adopt the same structures as those of Islamic banking instruments, including receivables (*sukuk al murabah*), leasing (*ijarah*), construction project (*istisna*), deferred delivery of assets (*salam*) or investments (*mudarabah*, *musharakah*).

<sup>1</sup> Under the wadiah contract, the deposit is based on trust, and the amount deposited may be used provided there is no intention of obtaining profits. Under the amanah contract, however, the deposit cannot be used, and the bank's activity is limited to custody and safekeeping.

<sup>2</sup> In respect of sukuk bonds, the investor may have a claim to the underlying asset itself (asset-backed) or recourse to the originator of the asset (asset-based).

With respect to the insurance sector, the *takaful* is the Islamic instrument which most resembles conventional insurance instruments, specifically those of mutual or cooperative insurance companies. However, unlike conventional insurance, the *takaful* policy holder shares the profits and losses of the business, and all the assets and investments managed by the Islamic insurance company must conform to Shari'ah precepts. The Islamic finance sector has other instruments such as Islamic investment funds, Islamic equity indices, such as the *Dow Jones Islamic Market Index* (DJIM) or Islamic microfinance based on a cooperative model.

Islamic finance market In recent years, the Islamic finance sector has grown rapidly, by almost 11.5 % between 2010 and 2015, while the conventional financial system grew by 3.2 % between 2010 and 2014.<sup>3</sup> At end-2015, the sector was valued at \$1.88 trillion,<sup>4</sup> accounting for nearly 1% of total financial assets worldwide (IFSB [2015 and 2016]).<sup>5</sup> This growth was largely underpinned by the accumulation of wealth of oil-exporting countries and the growth of capital markets in the Persian Gulf and Southeast Asia. In 2015, some slowdown was observed, owing to the fall in hydrocarbon prices and the lower growth of emerging markets, and to the exchange rate depreciation in jurisdictions with a large Islamic finance presence, including Iran, Malaysia, Turkey and Indonesia.

In addition to these short-term economic factors, growth of Islamic finance has also been driven by structural factors, which will no doubt continue to apply and provide sustained momentum. Firstly, the potential rise in demand for financial services by a Muslim population with still-low rates of access to and use of bank services. Currently, around 76% of the adult Muslim population do not have a bank account and 93% have no access to formal financing, as compared with 56% and 91%, respectively, of the non-Muslim population (population (Demirgüç-Kunt *et al.* [2013]). Further, it is estimated that the Muslim population will grow by 73% between 2010 and 2050, compared with 35% projected for the world population (Pew Research Center [2015]).

Secondly, another factor boosting Islamic finance is public-sector support for the promotion and development of Shari'ah-compliant markets and products. Thus, several national authorities in both Muslim and secular countries have been gradually adapting their legislation to enable the inclusion of Islamic finance instruments. Internationally, new organisations have been formed to promote the standardisation and regulation of Islamic financial instruments, such as the Islamic Financial Services Board (IFSB, in 2002) or the International Islamic Financial Market (IIFM, also in 2002). Also, institutions such as the International Monetary Fund, the World Bank, the Islamic Development Bank or the G20, have promoted seminars and studies to foster knowledge, access and integration of this type of instruments in the international financial system.

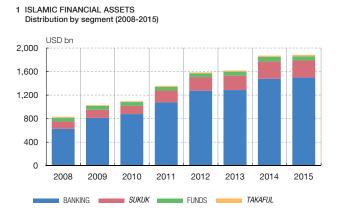

By geographical area, the largest proportion of Islamic financial assets are to be found in the Gulf Cooperation Council (GCC) countries (39%) and in the Middle East and North Africa (MENA) region (33%) (IFSB [2016]). By country, Iran (37%), Saudi Arabia (19%) and Malaysia (9%) are the top three in terms of the percentage of global Islamic banking assets. In recent years, Islamic finance has grown considerably in countries such as Bangladesh,

<sup>3</sup> Estimate based on the sum of assets of banks and other financial intermediaries relating to 26 jurisdictions (Financial Stability Board, FSB [2015]).

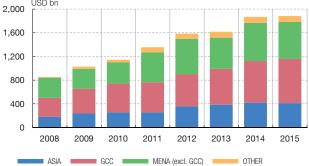

<sup>4</sup> Approximate estimate (may include duplication) of the total value of managed assets, measured as the sum of banking sector assets, Islamic funds and the value of outstanding sukuk issues and takaful contributions (IFSB [2016]).

<sup>5</sup> García-Herrero et al. (2008) analyse developments in Islamic finance since its beginnings in the 1960's.

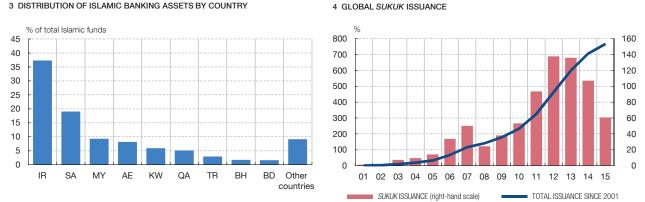

## ISLAMIC FINANCIAL ASSETS

2 ISLAMIC FINANCIAL ASSETS Distribution by region (2008-2015) USD bn

#### **3 DISTRIBUTION OF ISLAMIC BANKING ASSETS BY COUNTRY**

SOURCES: Islamic Financial Services Board, International Monetary Fund, International Islamic Financial Market and Banco de España.

Turkey, Jordan, Bahrain and Pakistan, with public-sector support aimed at developing this sector and adapting its regulations. In Europe,<sup>6</sup> the United Kingdom is the chief secular centre for Islamic finance, ranking ninth by volume of Islamic assets worldwide.

The degree of penetration in the financial sector overall varies depending on the jurisdiction. In countries such as Iran and Sudan, Islamic finance assets account for 100% (all banking assets are Shari'ah-compliant), and in a further 10 jurisdictions (Brunei, Saudi Arabia, Kuwait, Yemen, Qatar, Malaysia, Bangladesh, Bahrain, United Arab Emirates and Djibouti) Islamic finance is systemically important, accounting for more than 15% of total bank assets. However, in other countries (such as Egypt, Turkey or Indonesia), the degree of penetration is much lower (around 5%). Islamic finance is still in the very early stages of development in the European Union, although it has gradually gained importance in the United Kingdom and Luxembourg,7 and in other financial centres such as Switzerland, Hong Kong and the United States.

By sector, banking dominates the Islamic finance sector, accounting for almost 80% of the total. During the 2010-2015 period, average annual growth stood at 11.3 % (IFSB [2016]), substantially higher than that of conventional banking worldwide (around 3% in 2010-2014)

CHART 1

<sup>6</sup> For more information on Islamic finance in Europe, see Benali (2015).

Retail banking seems to have come to a standstill, following some initial timid attempts in the 1990's (Anca [2014]). However, the sukuk market and Islamic funds have experienced stronger growth, especially in these two countries.

(Financial Stability Board, FSB [2015]). The *sukuk* market experienced equally strong growth (15.7% in 2010-2015), with an issuance volume which rose from \$7 billion in 2003 to as much as \$137 billion in 2012 (IIFM [2016]). This upward trend was gradually reversed, notably in 2015, with a fall of 43% in issuance, owing largely to the Malaysian Central Bank's decision to end its short-term *sukuk* issuance programme.<sup>8</sup> In 2015, the outstanding balance represented 0.35% of the global bond market. By issuer, the volume of outstanding issues is distributed in practically equal proportions between sovereign issuers and private firms, while by country, a large proportion is concentrated in three jurisdictions: Malaysia (with almost 57% of the outstanding balance), Saudi Arabia (16%) and United Arab Emirates (10%). The United Kingdom was the first non-Islamic country to issue *sukuk* bonds for a value of £200 million in 2014 (the Federal State of Saxony had done so earlier, in 2005), subsequently followed by countries such as Luxembourg, South Africa, Hong Kong or Senegal. As regards currency, most *sukuk* bonds are issued in the Malaysian ringgit (64%), followed by the US dollar (18%) and the Saudi Arabian riyal (4.7%).

Lastly, note should be taken of the growth of Islamic investment funds, which went from managing assets valued at \$29 billion in 2004 to more than \$75 billion at end-2014, their activity mainly concentrated on shares (36%) and money markets<sup>9</sup> (35%),<sup>10,11</sup> These funds were initially set up in Saudi Arabia and GCC countries and later spread to other countries, including non-Muslim ones, which accumulate almost 40% of funds and 30% of investments. Europe, Luxembourg and Ireland<sup>12</sup> are major centres operating with Islamic funds, representing 20% and 4%, respectively, of the Islamic fund market outside Islamic countries.

Regulatory challenges<br/>posed by Islamic financeThe rapid growth and internationalisation of Islamic finance poses regulatory and supervisory<br/>challenges on two main fronts: on the one hand, the need to harmonise Islamic finance<br/>regulatory standards and, on the other, bringing them into line with those of conventional<br/>jurisdictions, where the additional problem of double or multiple taxation arises.

On the regulatory front, Islamic finance is highly heterogeneous as a result of the discretionary interpretation of the Shari'ah, which depends on each jurisdiction. This hampers growth of the sector and prevents effective integration. The regulatory framework becomes more complex in dual jurisdictions, where Islamic finance exists along with conventional banking under different frameworks. In countries such as Saudi Arabia and United Arab Emirates, there is a single regulatory and supervisory framework for all financial institutions. Others, like Malaysia, Turkey or Qatar, also have a single regulatory framework, but with specific references which apply only to Islamic banks. At the other extreme, there are countries like Bahrain, Irak and Kuwait, with dual regulatory and supervisory frameworks which distinguish between conventional and Islamic institutions.

<sup>8</sup> The Central Bank of Malaysia issues sukuk bonds on behalf of the Government, in order to manage the liquidity of the system. It recently replaced the issuance of sukuk bonds by that of other, more short-term Islamic instruments.

<sup>9</sup> Instruments traded in the Islamic money markets are Shari'ah-compliant. These include interbank investment (mudarabah), Government bonds or central bank issues, sale and repurchase agreements, deposits or Islamic debt certificates (public sector or private) (see the website of Malaysia's central bank: http:// iimm.bnm.gov.my/ index.php?ch=4&pg=4&ac=22).

<sup>10</sup> See IFSB (2015).

<sup>11</sup> There are currently around one thousand Islamic investment funds, twice as many as in 2004.

<sup>12</sup> See Di Mauro et al. (2013).

<sup>13</sup> The variety of measures and purchase and sale transactions required by some of these instruments could give rise to indirect, multiple taxation (see IMF [2015c]).

a Countries with an international organisation member.

**b** F: at least one full member.

A: with associated members.

c According to IFSB classification (2015).

Efforts to harmonise Islamic products and regulations<sup>14</sup> most notably include the work of the IFSB, whose members are official institutions from 43 countries and eight international organisations<sup>15</sup> (see table 3). The IFSB develops regulatory standards for Islamic finance taking the Basel regulations as the main reference framework. In this respect, the IFSB works closely with the Basel Committee on Banking Supervision, and the Bank for

<sup>14</sup> The main institutions involved in the standardisation and harmonisation of Islamic capital markets are the International Islamic Financial Market (IIFM) and the Accounting and Auditing Organisation for Islamic Financial Institutions (AAOIFI).

<sup>15</sup> It has 30 full members and 29 associate members, some being private institutions. In addition, industry representatives participate as observers.

International Settlements (BIS) is an observer member of the IFSB. Adherence to the IFSB principles and standards is voluntary and may also be partial.

The main regulatory challenge is the appropriate treatment of different risks affecting Islamic finance, both in terms of developing efficient risk management frameworks and adequate calibration of instruments for financial regulation purposes, and of the transparency implications for bank customers. Islamic institutions face a number of specific risks which include: greater liquidity risk, owing to the shortage of instruments, markets and hedging and financial derivatives instruments; greater operational risk, due to the specific contractual features of financing and the inadequate legal infrastructure, and from lower diversification since the focus is on underlying asset-based funding (sectoral concentration on real estate investment, construction or commodities); greater investment risk, owing to the uncertainty surrounding the return on investments backing these instruments; or a greater rate of return risk, owing to the risk of depositor flight if market rates rise beyond the rate of return offered by Islamic banks' own assets. However, there are certain specific aspects of Islamic finance which, in principle, provide for more financial stability than conventional finance.<sup>16</sup> For example, there are advantages in terms of lower leverage (loans are asset-based), greater incentive to control risks, and safety of investments, resulting from the risk-sharing framework linked to the underlying asset. Table 4 summarises the main regulatory challenges of Islamic finance.

Adapting Islamic finance to the jurisdictions of secular countries poses similar challenges. In Europe,<sup>17</sup> several countries are adapting their legislation to include Islamic finance, most notably the United Kingdom, Luxembourg and France. The general principle being applied is to make regulatory changes which will enable Islamic institutions to comply with the national regulatory framework on equal competitive conditions. These adaptations consist mainly of the recognition and specific calibration of Islamic finance instruments for financial regulation purposes and of regulatory changes aimed at bringing their tax treatment into line with that of conventional instruments. In this regard, some Islamic finance instruments raise the issue of double or multiple taxation, since they normally involve several transactions, each with a different form of taxation, when conventional banking would involve only one transaction. For example, mortgages based on the murabah and financing based on the ijarah principle are subject to double taxation (first, when the bank buys the house and, second, when the customer/buyer purchases the house from the bank). In the case of sukuk issuances, the main objective is to align the tax treatment of the profit and losses generated to that applied to the interest rates on the conventional debt instrument (mainly, tax relief from interest payments).

Islamic finance also poses significant monetary policy challenges.<sup>18</sup> The main challenge in this area is the development of short-term securities which may be used by Islamic institutions as collateral in their monetary transactions, and also to boost the monetary, interbank and *sukuk* markets. In parallel with improvements in macroprudential instruments

<sup>16</sup> IMF (2010) concludes that the initial impact of the Great Crisis on Islamic institutions was less marked than on conventional institutions, owing to the lower volume of loan portfolios, lower leverage and application of Islamic principles.

<sup>17</sup> Application of Basel III in Europe indirectly refers to aspects of Islamic finance. More specifically, Commission Delegated Regulation (EU) 2015/61, referring to the liquidity coverage requirements for credit institutions includes, in Article 12 on "Level 2B assets" exceptions for "credit institutions which in accordance with their statutes of incorporation are unable for reasons of religious observance from holding interest bearing assets", allowing them to provide evidence of availability of non-interest bearing assets meeting these requirements and which are adequately liquid in private markets (European Union, 2014).

<sup>18</sup> See IMF (2016).

## KEY CHALLENGES OF ISLAMIC FINANCIAL SYSTEMS Challongoe and implications

| Aspects                          | Challenges and implications  |
|----------------------------------|--|
| Capital<br>adequacy              | The elements which may be eligible for treatment as additional Tier 1 and Tier 2 capital must be identified, with a view to applying Basel III. The asset risk assessment must also be calibrated: on one hand, transferring profit and loss from assets to liabilities reduces risk, entailing a lower capital requirement; on the other, greater exposure to liquidity risk due to the volatile prices of Islamic finance assets would suggest a higher capital requirement. In general terms, in the absence of regulatory adaptation, Islamic institutions would have to accumulate more capital than their «conventionals» competitors, affecting their profitability [Iqbal (2014)]. |
| Liquidity ratios                 | Islamic institutions face a greater liquidity risk (due to the scant development of short-term liquidity markets and products, the shortage of Islamic securities/sukuk and Islamic institutions' lack of access to central bank liquidity [LoLR]), which make it advisable to strengthen their liquidity ratios. However, in order to be able to meet the net stable funding ratio (NSFR), these institutions maintain higher levels of cash and non-productive liquid assets than those of their conventional competitors, which results in less efficient liquidity management with the consequent impact on results.   |
| Consumer and investor protection | Islamic instruments may give rise to problems as a result of the inappropriate perception on the part of consumers of their exposure to the underlying asset risk, which requires institutions to have clear and transparent customer communication policies. Also, investment account holders bear additional risks to those of conventional banking.   |
| Financial safety nets            | The main problem is that the instruments to which Islamic institutions have access are limited or non-existent. The difficulties of designing Shari'ah lender of last resort (SLOLR) facilities or deposit guarantee funds which are compatible with Islamic law hamper the efficient management of the system's liquidity   |
| Resolution<br>frameworks         | International resolution instruments are generally applicable to Islamic institutions, but the specificities of these need to be recognised. Thus, the insolvency regime requires legislative adaptation, particularly regarding profit-sharing investment accounts and other deposit accounts.  |

SOURCE: Banco de España, based on International Monetary Fund (2010 and 2015a) and International Monetary Fund and World Bank (2015).

in conventional jurisdictions, Islamic regulators must strengthen their instruments, focusing particularly on the risks deriving from the close relationship between deposits and investments, and on the high concentration of assets in sectors which are closely linked to the economic cycle.

## Conclusions

Asposts

In recent years, Islamic finance has undergone an internationalisation process and has grown significantly. The sector has a great potential for development, taking into account the investment needs of emerging economies where Islamic finance is present, and the potential demand from the Muslim population worldwide, which has very low levels of access and use of bank services. The future development of Islamic finance requires a qualitative change in its regulation using Basel standards as the guiding reference. In this respect, the main challenges are the standardisation and harmonisation of regulatory and supervisory standards of the different Islamic jurisdictions, to facilitate their internationalisation and increase competitiveness in the sector. When part of a conventional system, Islamic finance must adapt to national legislations, without prejudice to calibrating its specific financial regulation and tax features, to allow Islamic institutions to participate in equal competitive conditions.

#### EXCHANGE RATES

INDICES OF THE REAL EFFECTIVE EXCHANGE RATE BASED ON CONSUMER PRICES VIS-À-VIS THE DEVELOPED COUNTRIES

Sources: ECB and BE.

a. Geometric mean calculated using a double weighting system based on (1995-1997),(1998-2000), (2001-2003), (2004-2006) and (2007-2009) manufacturing trade of changes in the

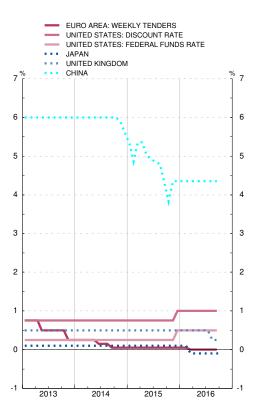

spot price of each currency against the currencies of the other developed countries. A fall in the index denotes a depreciation of the currency against those of the other developed countries.

b. Obtained by multiplying the relative prices of each area/country (relation betwen its price index and the price index of the group) by the nominal effective exchange rate. A decline in the index denotes a depreciation of the real effective exchange rate and, may be interpreted as an improvement in that area/country's competitiveness.

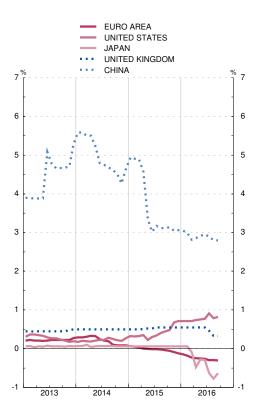

## 2.5. CENTRAL BANK INTERVENTION INTEREST RATES AND SHORT-TERM DOMESTIC MARKET INTEREST RATES

LABOUR FORCE SURVEY Annual percentage change

LABOUR FORCE Annual changes

Source: INE (Labour Force Survey: 2005 methodology).

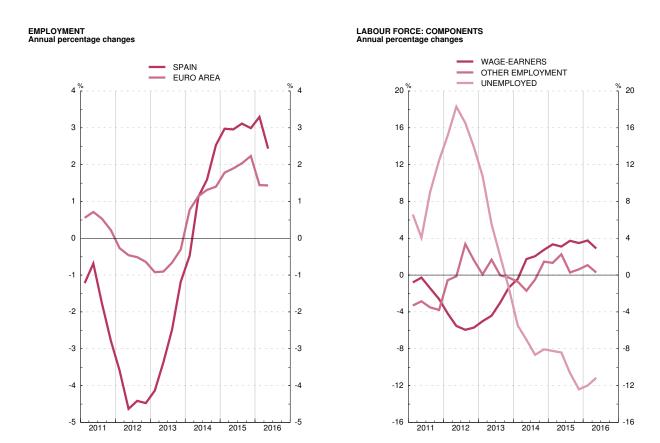

a. Col.7 = (col.5/col.1)x annual change in col.2; Col.8 = (annual change in col.4/100) x col.1(t-4). General note to the tables: As a result of the change in the population base (2011 Census), all the series in this table have been revised as from 2002. In addition, since 2005 Q1 the new obligatory variables referred to in Regulation (EC) 2257/2003 (on the adaptation of the list of labour force survey characteristics) have been included, a centralised procedure for telephone interviews has been set in place and the questionnaire has been modified. Thus, in 2005 Q1, there is a break in the series of some variables. For further information, see www.ine.es

Sources: INE (Labour Force Survey: 2005 methodology), and ECB.

General note to the tables: As a result of the change in the population base (2011 Census), all the series in this table have been revised as from 2002. In addition, since 2005 Q1 the new obligatory variables referred to in Regulation (EC) 2257/2003 (on the adaptation of the list of labour force survey characteristics) have been included, a centralised procedure for telephone interviews has been set in place and the questionnaire has been modified. Thus, in 2005 Q1, there is a break in the series of some variables. For further information, see www.ine.es.

Source: INE (Labour Force Survey: 2005 methodology).

General note to the tables: As a result of the change in the population base (2011 Census), all the series in this table have been revised as from 2002. In addition, since 2005 Q1 the new obligatory variables referred to in Regulation (EC) 2257/2003 (on the adaptation of the list of labour force survey characteristics) have been included, a centralised procedure for telephone interviews has been set in place and the questionnaire has been modified. Thus, in 2005 Q1, there is a break in the series of some variables. For further information, see www.ine.es.

## 4.5. REGISTERED UNEMPLOYMENT BY BRANCH OF ACTIVITY. CONTRACTS AND PLACEMENTS. SPAIN

EMPLOYEES AFFECTED January - September

Source: Ministerio de Empleo y Seguridad Social, Estadística de Convenios Colectivos de Trabajo.

a. The data include agreements registered after the end of the year.
b.Until 2010, includes revisions arising from indexation clauses.
c. The information on the number of collective bargaining agreements registered in 2013 with economic effects in 2013 is not homogeneous with respect to that of the same period a year earlier.

GENERAL GOVERNMENT DEBT ACCORDING TO THE EDP By sub-sector. Billions of euro

GENERAL GOVERNMENT DEBT ACCORDING TO THE EDP By instrument. Billions of euro

EUR millions

SOURCE: BE.

a. The most recent data to have been checked against those of the regional (autonomous) governments and the thirteen largest municipalities correspond to June 2016. b. Since July 2014, the debt (loans and securities) of the Fund for the Financing of Payments to Suppliers (FFPS) has been included in the debt of the State instead of in Other Central Government Units, owing to the integration of the latter into the State. From January 2015, this indicator incorporates the effect of the creation of the Fund for the Financing of Regional Governments and the Fund for the Financing of Local Governments, which are also included in the State and have assumed the outstanding amounts of FFPP and FLA as at December 2014.

## 6.3. STATE RESOURCES AND USES ACCORDING TO THE NACIONAL ACCOUNTS. SPAIN

EUR millions

SUMMARY

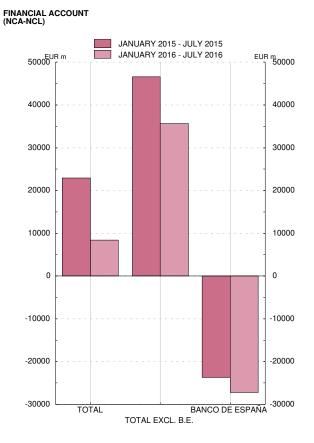

Source: BE.

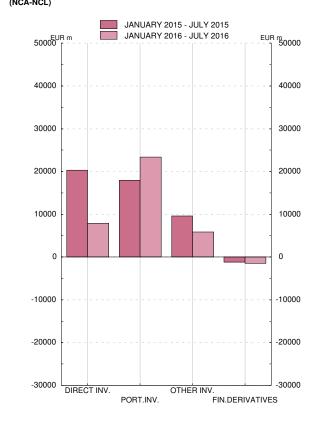

a. A positive sign for the current and capital account balances indicates a surplus (receipts greater than payments) and, thus, a Spanish net loan abroad (increase in the creditor position or decrease in the debtor position).

## 7.2. SPANISH BALANCE OF PAYMENTS VIS-à-VIS OTHER EURO AREA RESIDENTS AND THE REST OF THE WORLD. FINANCIAL ACCOUNT

Series depicted in chart.

#### Source: BE.

Note: From January 1999 the assets denominated in euro and other currencies vis-à-vis residents of other euro area countries are not considered reserve assets. To December 1998, data in pesetas have been converted to euro using the irrevocable euro conversion rate. Since January 1999, all reserve assets are valued at market prices. Reserve assets data have been compiled in accordance with the IMF's new methodological guidelines published in the document 'International Reserves and Foreign Currency Liquidity Guidelines for a Data Template', 2013 (https://www.imf.org/external/np/sta/ir/IRProcessWeb/pdf/guide2013.pdf)

FINANCING OF NON-FINANCIAL SECTORS Annual percentage change

Source: BE.

a. The annual percentage changes are calculated as the effective flow of the period / the stock at the beginning of the period.
b. Total liabilities (consolidated). Inter-general government liabilities are deduced.
c. Including loans transferred to SAREB, which is an Asset Management Corporation (AMC).

#### Source: BE.

a. The annual percentage changes are calculated as the effective flow of the period / the stock at the beginning of the period. b. Includes issues of resident financial subsidiaries of non-financial corporations, insofar as the funds raised in these issues are routed to the parent company as loans. The issuing institutions of these financial instruments are classified as Other financial intermediaries in the Statistical Bulletin and in the Financial Accounts of the Spanish Economy. c. Including Ioans transferred to SAREB, which is an Asset Management Corporation (AMC).

CREDIT BY END-USE Annual percentage changes (c)

SOURCE: BE.

a. See chapters 4.13, 4.18 y 4.23 of the Statistical Bulletin and their notes which are published at www.bde.es and the notes of changes.

b. Includes loans and credit to households for the purchase of land and rural property, the purchase of securities, the purchase of current goods and services not considered to be consumer durables (e.g. loans to finance travel expenses) and for various end-uses not included in the foregoing.

c. Asset-backed securities brought back onto the balance sheet as a result of the entry into force of Banco de España Circular BE 4/2004 have caused a break in the series in June 2005. The rates depicted in the chart have been adjusted to eliminate this effect.

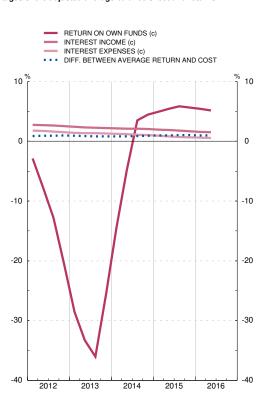

d. Including: construction, real estate activities and home purchases and improvements

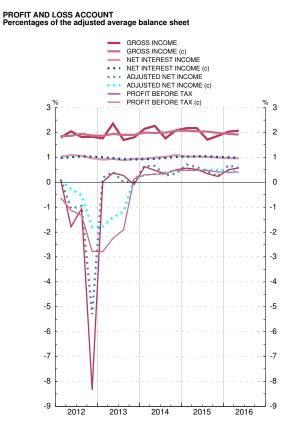

#### 8.10. PROFIT AND LOSS ACCOUNT OF DEPOSIT-TAKING INSTITUTIONS RESIDENT IN SPAIN

PROFIT AND LOSS ACCOUNT Percentages of the adjusted average balance sheet and returns

Source: BE.

Note: The underlying series for this indicator are in Table 4.36 of the BE Statistical Bulletin. a. Profit before tax divided by own funds.

c. Average of the last four quarters.

b. Only those financial assets and liabilities which respectively give rise to financial income and costs have been considered to calculate the averge return and cost.

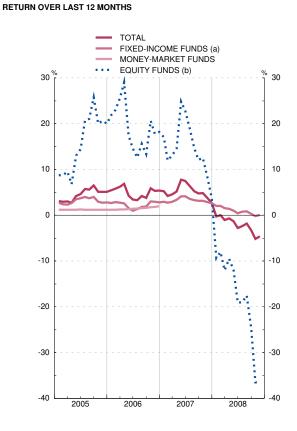

#### 8.11. MUTUAL FUNDS RESIDENT IN SPAIN

Series depicted in chart.

LOANS SYNTHETIC RATES

Source: BE.

a. This table is included among the IMF's requirements to meet the Special Data Dissemination Standards (SDDS)

b. APRC: annual percentage rate of charge. NEDR: narrowly defined effective rate, which is the same as the APRC without including commissions.
 c. Calculated by adding to the NDER rate, which does not include commissions and other expenses, a moving average of such expenses.

d. The synthetic rates of loans and deposits are obtained as the average of the interest rates on new business weighted by the euro-denominated stocks included in the balance sheet for all the instruments of each sector.

e. Up to the reference month May 2010, this column includes credit granted through credit cards (see the 'Changes' note in the July-August 2010 Statistical Bulletin).

#### INDICES OF SPANISH COMPETITIVENESS VIS À VIS THE EU-28

INDICES OF SPANISH COMPETITIVENESS VIS À VIS THE EURO AREA

#### Source: BE.

a. Outcome of multiplying nominal and cost/price components. A decline in the index denotes an improvement in the competitiveness of Spanish products. b. Geometric mean calculated using a double weighting system based on (1995-1997), (1998-2000), (2001-2003),

(2004-2006) and (2007-2009) manufacturing foreign trade figures.

c. Relationship between the price indices of Spain and of the group.

d. Quarterly series. Indices for Spain have been calculated using data for Unit Labour Costs (total and manufacturing) compiled from Quarterly Spanish National Accounts. Base 2010. Source INE.

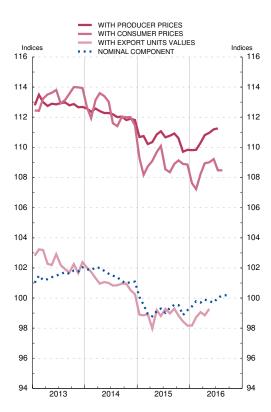

#### 9.5 INDICES OF SPANISH COMPETITIVENESS VIS-à-VIS THE DEVELOPED COUNTRIES AND INDUSTRIALISED COUNTRIES

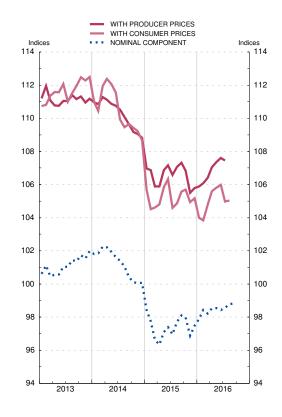

Series depicted in chart.

#### INDICES OF SPANISH COMPETITIVENESS VIS-À-VIS THE DEVELOPED COUNTRIES

INDICES OF SPANISH COMPETITIVENESS VIS-À-VIS THE INDUSTRIALISED COUNTRIES

#### Source: BE.

a. Outcome of multiplying nominal and cost/price components. A decline in the index denotes an improvement in the competitiveness of Spanish products. b. Geometric mean calculated using a double weighting system based on (1995-1997), (1998-2000), (2001-2003),

(2004-2006) and (2007-2009) manufacturing foreign trade figures.
c. Relationship between the price indices of Spain and of the group.

d. Quarterly series. Indices for Spain have been calculated using data for Unit Labour Costs (total and manufacturing) compiled from Quarterly Spanish National Accounts. Base 2010. Source INE.

## BANCO DE ESPAÑA PUBLICATIONS

The Banco de España publishes various types of documents providing information on its activity (economic reports, statistics, research papers, etc.). The full list of Banco de España publications can be found on its website at http://www.bde.es/f/webbde/Secciones/Publica-ciones/Relacionados/Fic/cat\_publ.pdf.

The list of articles published in the Economic Bulletin since 1990 can be consulted at http:// www.bde.es/f/webbde/Secciones/Publicaciones/InformesBoletinesRevistas/BoletinEconomico/ indice\_general\_ingles.pdf.

Most of these documents are available in pdf format and can be downloaded free of charge from the Banco de España website at http://www.bde.es/webbde/en/secciones/informes/. Requests for others should be addressed to publicaciones@bde.es.

## COUNTRIES AND CURRENCIES

In accordance with Community practice, the EU countries are listed using the alphabetical order of the country names in the national languages.

| SIVI | Single Supervisory Mechanism                      |  |  |  |
|------|---|--|--|--|
| RGET | Trans-European Automated Real-time Gross settleme |  |  |  |
|      | Express Transfer system                           |  |  |  |
| P    | Total factor productivity                         |  |  |  |
| TROs | Targeted longer-tem refinancing operations        |  |  |  |
| Cs   | Unit labour costs                                 |  |  |  |
| ΛT   | Value Added Tax                                   |  |  |  |
|      |   |  |  |  |
|      |   |  |  |  |

#### CONVENTIONS USED

- Notes and coins held by the public + sight deposits. M1
- M2 M1 + deposits redeemable at notice of up to three months + deposits with an agreed maturity of up to two years.
- MЗ M2 + repos + shares in money market funds and money market instruments + debt securities issued with an agreed maturity of up to two years.
- Q1, Q4 Calendar quarters.
- H1, H2 Calendar half-years.
- Billions (109). bn
- Millions. m
- Basis points. bp
- рр Percentage points.
- Not available. ····
- Nil, non-existence of the event considered or insignificance of changes when expressed as rates of growth.
- 0.0 Less than half the final digit shown in the series.
